Preliminary Results of ADWR's Well Survey in the San Simon Valley Sub-basin of the Safford Groundwater Basin, (5/12/2015)

During February and March of 2015, ADWR field personnel measured the depth-to-water in several hundred wells in the San Simon Valley Sub-Basin. The water level measurements were obtained to provide information on groundwater level depths and rates of groundwater level change throughout the sub-basin. Normally, water level data collected by ADWR undergo several months of preliminary internal review and quality assurance before being classified as final data. During the review process the water level data are checked for accuracy and consistency with past measurements and trends observed at the well and for non-standard measurement conditions that may have affected the measurement or the interpretation of the data (such as, recent or nearby pumping, cascading water, foreign material or oil in the well, well obstructions, etc.).

At this time, the review process for the San Simon Valley Sub-Basin data is incomplete. However, the Department believes that the data are useful for identifying large-scale, groundwater level change trends within the sub-basin in their preliminary state. Therefore, the data below are being released as "Preliminary Data Subject to Revision." Finalized groundwater level data for the San Simon Sub-basin and the Willcox and Douglas Basins will be published later this summer in a regional groundwater monitoring report.
