

Short-term Drought Status Report

November 2016

Arizona's short-term drought conditions have not changed over the past month.

The three storm systems that moved through the state in November provided just enough moisture to prevent an intensification of the drought, but not enough to improve conditions around the state.

The Colorado Plateau has been wetter than normal, but the western and southeast parts of the state were quite dry in November. Unless there is a continued winter storm activity in the next couple of weeks, conditions are expected to degrade.

Summary produced by the State Drought Monitoring Technical Committee — December 2, 2016
