PROTECTING ARIZONA'S
WATER SUPPLIES
for ITS NEXT CENTURY

AZCORS Network

The Arizona Continuously Operating Reference Station Network (AZCORS) is an open and free geodetic data source that is operated and managed by the Arizona Department of Water Resources (ADWR). All end-users need to register for a free AZCORS account for access to both real-time and RINEX data files: <https://azcors.azwater.gov/sbc/Account/Index?returnUrl=%2Fsb%2F>

AZCORS Spider Business Center (azcors.azwater.gov):

- Click on the top-right button to Create Account
- Enter your Personal Information (Name, email, company, etc.)
- Create a Username and password to access the Spider Business Center (SBC)
- Create an NTRIP Username and password to access the real-time RTK datastream.
- Click on the bottom-right box to accept the Terms of Use and click the button to Sign Up.
- Each login credential is provided with 1 simultaneous login. If you require multiple simultaneous logins using a single account, please email: azcors@azwater.gov with the number of simultaneous logins that you would like to request and the account will be updated.

Account Confirmation Steps:

- Receive an email with a link to confirm that your account was created. Click on the link in the email to confirm your registration.
- Receive a second email confirming that you are now registered.
- Login to your account at azcors.azwater.gov and you will see that you are subscribed to AZCORS data: SBC Rinex and/or NTRIP RTK

RINEX Data Access:

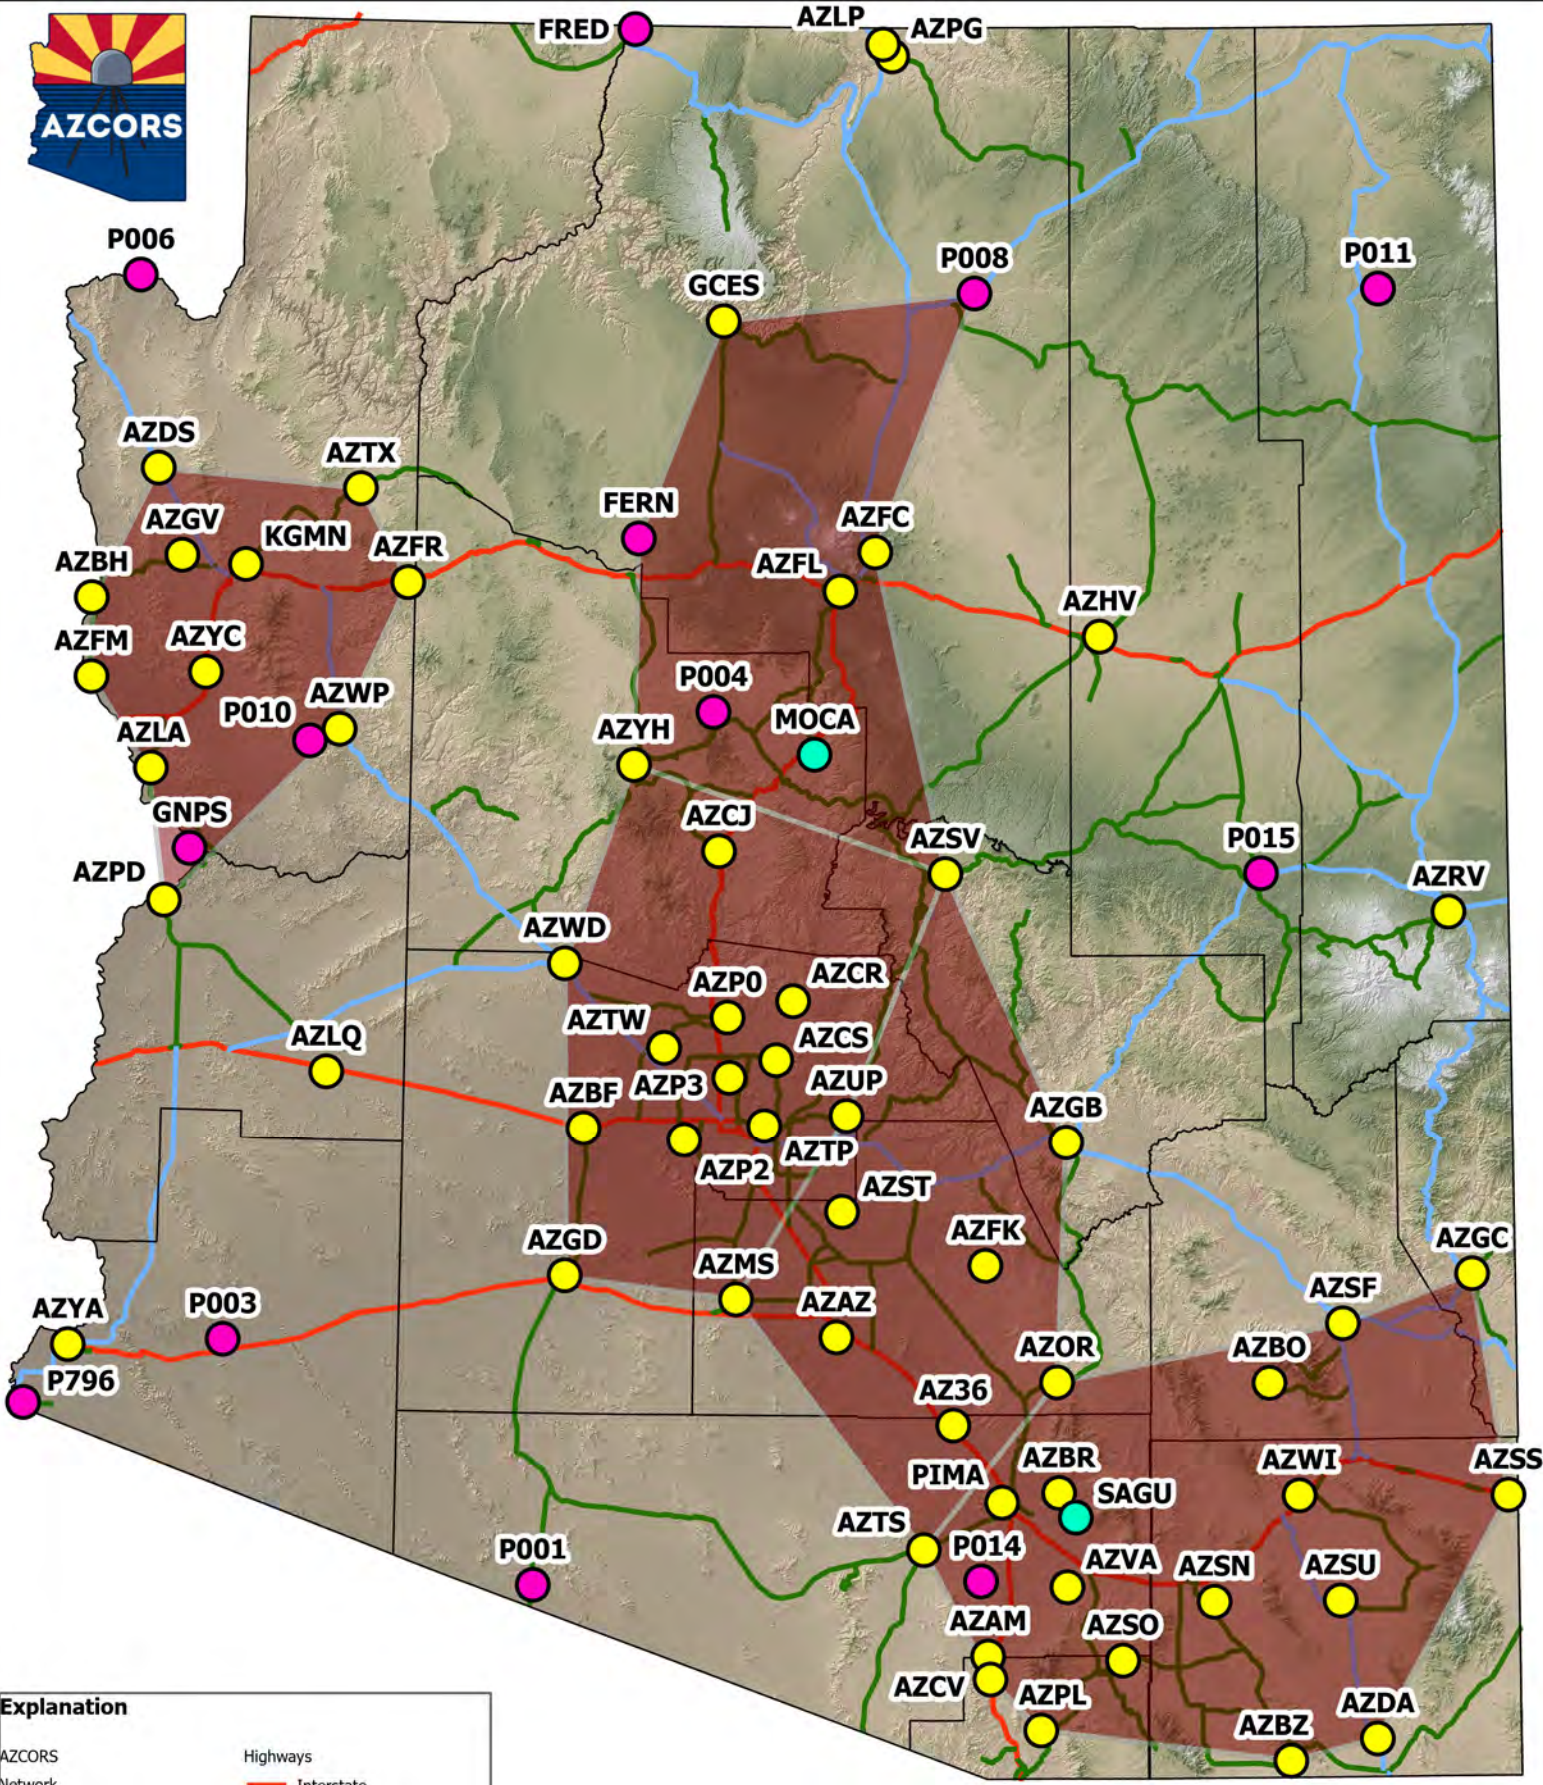

- Rinex3 Data Access is available through your account on the SBC web portal azcors.azwater.gov

NTRIP RTK DataStream:

- The IP address to use in your equipment to access the NRIP RTK datastream is: 159.87.113.135 and port 8080.
- When you are using the AZCORS Network RTCM RTK datastream, I would recommend using one of the automatic mountpoints. When you are working within a Network Solution Area (Shaded Area), I would use one of those mountpoints such as VRS_MSM5, VRS_RTCM3, IMAX_MSM5, etc. A network solution mountpoint is more accurate and precise than a single baseline solution mountpoint. If you are outside a network solution area, I would recommend using the other automatic mountpoint, NEAR, such as RTCM3_NEAR or MSM5_NEAR. This mountpoint will select the best CORS site for your location. Any mountpoint with RTCM in the name will use the GPS and GLONASS constellations and any mountpoint with MSM in the name will use GPS, GLONASS, Galileo, and BeiDou constellations.

AZCORS NTRIP RTK Datums:

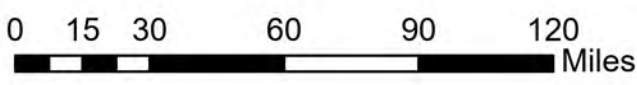

- 51 of the 58 AZCORS sites managed by ADWR are part of the National Geodetic Survey (NGS) National CORS Network (NCN) and use the published NGS datasheet coordinates, NAD 83(2011) EPOCH - 2010.00. The other 7 AZCORS sites were processed using the NAD 83(2011) EPOCH - 2010.00 coordinates from the surrounding AZCORS sites. The 13 EarthScope and the 2 National Park Service CORS sites that are ingested into the AZCORS network and distributed on the NTRIP RTK datastream also use NAD 83(2011) EPOCH - 2010.00 coordinates. The 10 EarthScope CORS sites that are part of the NCN use the published NGS datasheet coordinates. The 3 EarthScope and the 2 National Park service CORS sites that are not part of the NCN use NAD 83(2011) EPOCH - 2010.00 coordinates that are computed by ADWR at least twice a year using OPUS and OPUS-Projects. There is a total of 71 CORS sites (AZCORS, EarthScope, and NPS) that are available on the AZCORS Network. The vertical datum for all CORS sites is NAVD88.
